1 Introduction

1.1 What is Arduino Uno?

The Arduino Uno is one of the most widely used microcontroller development boards. It is built around the ATmega328P microcontroller, a low-power 8-bit chip that makes it easy for beginners and professionals to create electronic projects. Key features of the Arduino Uno include:

- **14 Digital Input/Output Pins** → Can be used to read digital signals (e.g., button press) or control devices (e.g., turning an LED ON/OFF).
- **6 Analog Input Pins** → Allow the board to read continuous signals, such as voltage from sensors (e.g., temperature or light intensity).
- **PWM (Pulse Width Modulation)** → Some digital pins can generate analog-like signals, useful for dimming LEDs or controlling motor speed.
- **USB Connectivity** → Used for programming the board and providing power.

The Arduino Uno is popular because it is open-source, affordable, and beginner-friendly, making it an excellent choice for learning embedded systems and hardware programming.

1.2 Why Simulate?

In traditional labs, you would need physical boards, sensors, wires, and other hardware. While this is important for real-world applications, it can be challenging for beginners due to wiring mistakes, hardware costs, or limited availability. By using a simulator, we can:

- **Work Safely** → No risk of burning components or damaging hardware.
- **Save Time and Cost** → No need to purchase parts; everything is virtual.
- **Debug Easily** → Visual tools help track signals, values, and errors in real time.
- **Experiment Freely** → Try ideas without worrying about breaking the board.

Simulation allows students to focus on learning logic, coding, and system design before handling real-world electronics.

1.3 Overview of Wokwi

Wokwi is an online Arduino simulator that works directly in your web browser. No installation or setup is required. Key advantages of Wokwi:

- **Free and Online** → Runs on any computer with internet access.
- **Arduino Support** → Fully supports Arduino Uno, Nano, Mega, and other boards.

- **Wide Range of Components** → LEDs, buttons, sensors, motors, displays, and more.
- **Real-Time Simulation** → Code runs instantly, and you can interact with components (e.g., pressing buttons, adjusting potentiometers).
- **Serial Monitor Support** → Just like the real Arduino IDE, you can see program output in real time.

With Wokwi, you can practice coding in C for Arduino, build circuits, and simulate projects without any physical hardware, making it ideal for classroom teaching and learning.

2 Wokwi Setup

Access the Wokwi website by searching "Wokwi" on Google, or by navigating directly to the following link ([Wokwi](https://wokwi.com)). You should create an account to save your project. Wokwi allows you to create an account easily using your Google email or an equivalent service.

- Once on the main page and logging in, select Arduino (Uno, Mega, Nano).
- From Start From Scratch section on the main page, select Arduino Uno.
- The following environment will open up. The left half is the part where you will enter your code and on the right hand side is the Arduino board in the circuit drawing area.
- The green play button is the "Start the Simulation" button. Clicking it will start the simulation.
- The blue plus button allows you to select and add components to the circuit area.
- The grey 3 dotted button allows you to change the appearance of the circuit drawing area.

3 Arduino Uno Board

In the Wokwi simulator, the Arduino Uno board looks exactly like the physical version, and all its components work the same way during simulation. Features available on the board are detailed below.

3.1 Power

In Wokwi simulation, the board is automatically powered ON as soon as you click the green “Start Simulation” button. You don’t need to connect power manually. The power indicator is shown in red box 1 in the figure below. If the LED is glowing, it means the board is receiving power and your code is running.

3.2 Reset

The Reset button on the Arduino Uno is located near the USB connector at the top left of the board as shown in red box 2 in the below figure. Its purposes are 1) Restarts the microcontroller (ATmega328P), 2) Stops the running program and begins executing it again from the start, and 3) Useful for debugging, testing, or restarting your circuit without stopping the whole simulation. You can click the Reset button directly with your mouse. The program restarts instantly, just as it would on the real board. The ON power LED stays lit (showing the board still has power), but your code runs from the beginning.

3.3 On-board LED

The Arduino Uno board has a built-in LED as shown in red box 3 in the below figure. It’s a single LED that is labeled with the letter "L" on the board. This LED is connected to digital pin 13 in most Arduino boards.

3.4 Microcontroller

The microcontroller on the Arduino Uno is the ATmega328P, which serves as the "brain" or "heart" of the board. Its primary purpose is to execute the program that you upload to it. In the Wokwi simulator, it functions exactly as it would on the physical board. Its purpose is to serve as the central processing unit, executing the code you write to control the board's behavior. The Wokwi simulator accurately models this behavior, allowing you to see how your program affects the microcontroller and any connected components. The microcontroller is shown in red box 4.

3.5 Analog and Power Pins

The Analog and Power pins are two crucial groups of pins on the Arduino Uno that manage how the board interacts with real-world signals and how it receives or provides electrical energy. Both are modeled accurately in the Wokwi simulator and are shown in red box 5.

The Arduino Uno board has six Analog Input pins, labeled A0 through A5. These pins are found near the Power header on the bottom right of the board. Their primary role is to measure continuous signals from analog sensors, such as reading the varying voltage output from a temperature sensor or a potentiometer. They are connected to an internal Analog-to-Digital Converter (ADC) inside the ATmega328P microcontroller. The ADC takes the analog voltage (which can be any value between 0V and 5V) and converts it into a digital number ranging from 0 to 1023 (a 10-bit resolution). Although labeled "Analog In," these pins can also be configured and used as General Purpose Digital Input/Output (GPIO) pins if you need extra digital pins in your project.

3.6 Digital Pins

The Digital Input/Output (I/O) Pins on the Arduino Uno board (Pins 0 to 13) are the primary way the microcontroller interacts with external components using a binary, or two-state, logic system. The Arduino Uno has 14 digital I/O pins in total, numbered D0 to D13. These pins function as General-Purpose Input/Output (GPIO), meaning they can be configured to:

- **Input Mode:** Used to read digital signals (a value of either HIGH or LOW) from a device, such as reading whether a button has been pressed or a sensor has crossed a threshold. HIGH represents the board's operating voltage, which is 5V on the Uno. LOW represents 0V (Ground).
- **Output Mode:** Used to control devices by setting the pin voltage to either HIGH (5V) or LOW (0V), such as turning an LED ON/OFF or activating a relay.

4 Language and Sketches

4.1 The Language

The programming language used for Arduino, and thus within the Wokwi simulator, is based on C++ but is simplified by the Wiring framework. This language is specifically designed for ease of use in electronics and embedded programming. It abstracts complex hardware register manipulation into simple, clear functions like `pinMode()`, `digitalWrite()`, and `analogRead()`.

4.2 The Sketch

An Arduino program is referred to as a sketch. Every sketch is structured around two mandatory functions:

- **`void setup()`:** This function is the initialization block. it runs only once immediately after the program starts or the board is reset, and its primary purpose is to set up the necessary initial conditions for the Arduino. Within this function, you configure hardware settings such as defining which digital pins will act as inputs or outputs using the `pinMode()` function, starting any necessary serial communication with `Serial.begin()`, and initializing external libraries or variables.
- **`void loop()`:** This function is executed directly after the completion of the `setup()`. This is the main execution block of the sketch. This function runs the program's primary logic continuously and repeatedly until simulation is stopped, allowing the Arduino to perform its ongoing tasks, such as constantly checking the state of sensors with `digitalRead()`, controlling actuators with `digitalWrite()` or `analogWrite()`, and responding to changing conditions in the environment.

5 Using the Serial Monitor

The Serial Monitor allows the Arduino Uno to send and receive text data from your computer. This is the first step to debugging and interacting with your programs. Type the following code in the editor and click the Start Simulation button to start the simulation.

5.1 Printing with Serial.print() and Serial.println()

Program 1

```
1 void setup()
2 {
3   Serial.begin(9600); // Start serial communication at 9600 bits/sec
4   Serial.print("Hello"); // Print text (stays on the same line)
5   Serial.print(" World!"); // Continue on the same line
6   Serial.println("<- This ends with a new line"); // Print and move to
7     the next line
8   Serial.print("Exiting..."); // This message is printed on a new line
9 }
10
11 void loop()
12 {
13   // Nothing here, code runs only once in setup()
14 }
```

5.2 Printing Variables

Program 2

```
1 int counter = 0; // Declare a counter variable
2
3 void setup()
4 {
5   Serial.begin(9600);
6 }
7
8 void loop()
9 {
10   Serial.print("Counter value: ");
11   Serial.println(counter); // Print value and move to next line
12   counter++; // Increase counter by 1
13   delay(1000); // Wait for 1 second before repeating
14 }
```

5.3 Reading Input using Serial.read()

Program 3

```
1 char command; // Variable to store the received character
2
3 void setup()
4 {
5     Serial.begin(9600);
6     Serial.println("Enter a character: ");
7 }
8
9 void loop()
10 {
11     // Check if data is available in Serial Monitor
12     if (Serial.available() > 0)
13     {
14         command = Serial.read(); // Read one character
15
16         // Ignore non-printable characters like newline and carriage return
17         if (command != '\n' && command != '\r')
18         {
19             Serial.print("You entered: ");
20             Serial.println(command);
21             Serial.println("Enter a character: ");
22         }
23     }
24 }
```

6 Using LEDs and Buzzer

6.1 Blink on-board LED

Program 1

```
1 void setup()
2 {
3     pinMode(LED_BUILTIN, OUTPUT); // Set on-board LED as output
4 }
5
6 void loop()
7 {
8     digitalWrite(LED_BUILTIN, HIGH); // LED on
9     delay(1000);
10    digitalWrite(LED_BUILTIN, LOW); // LED off
11    delay(1000);
12 }
```

6.2 Blink external LED

Program 2

```
1 void setup()
2 {
3   pinMode(5, OUTPUT); // Configure digital pin 5 as output
4   // Connected to external LED
5 }
6
7 void loop()
8 {
9   digitalWrite(5, HIGH); // LED on
10  delay(1000);
11  digitalWrite(5, LOW); // LED off
12  delay(1000);
13 }
```

6.3 Continuous Tone on Buzzer

Program 3

```
1 int buzzerPin = 2; // Buzzer connected to Pin 2
2
3 void setup()
4 {
5   pinMode(buzzerPin, OUTPUT); // Set Pin 2 to Output
6   Serial.begin(9600);
7 }
8
9 void loop()
10 {
11   tone(buzzerPin, 1000); // Play a 1 KHz tone continuously
12   Serial.println("Buzzing");
13   delay(500);
14 }
```

6.4 Beep, Pause & Repeat - Method 1

Program 4

```
1 int buzzerPin = 2; // Buzzer connected to Pin 2
2
3 void setup()
4 {
5   pinMode(buzzerPin, OUTPUT);
6   Serial.begin(9600);
7 }
```

```
8 }  
10 void loop()  
11 {  
12     tone(buzzerPin, 1000); // Play a 1 KHz tone  
13     Serial.println("Buzzing");  
14     delay(500);  
15     noTone(buzzerPin); // No tone on buzzer after 500ms  
16     delay(500);  
17 }
```

6.5 Beep, Pause & Repeat - Method 2

Program 5

```
1 int buzzerPin = 2; // Buzzer connected to Pin 2  
3 void setup()  
4 {  
5     pinMode(buzzerPin, OUTPUT);  
6     Serial.begin(9600);  
7 }  
9 void loop()  
10 {  
11     Serial.println("Buzzing");  
12     tone(buzzerPin, 1000, 1000); // Play a 1 KHz tone for 1000ms or 1sec  
13     // Avoids noTone()  
14     delay(1000); // wait while it plays  
15     Serial.println("No buzz");  
16     delay(1000); // 1 sec of silence  
17 }
```

7 IF-ELSE & Switch Constructs

7.1 Using Push Button (Press and Hold) and External LED

Program 1

```
1 int buttonPin = 2; // Push button connected to pin 2  
2 int ledPin = 5; // LED connected to pin 5  
3 int buttonState; // Variable to store button status  
4  
5 void setup()
```

```
6 {  
  pinMode(buttonPin, INPUT_PULLUP); // Use internal pull-up (button active  
  LOW)  
8  pinMode(ledPin, OUTPUT); // LED as output  
9}  
10  
11 void loop()  
12 {  
  buttonState = digitalRead(buttonPin); // Read button  
13  
14  if (buttonState == LOW) // Button pressed  
15  {  
    digitalWrite(ledPin, HIGH); // LED ON  
16  }  
17  else // Button not pressed  
18  {  
    digitalWrite(ledPin, LOW); // LED OFF  
19  }  
20 }  
21  
22 }
```

7.2 Toggling LEDs based on User Choice

Program 2

```
1 char choice;  
2  
3 void setup()  
4 {  
5   pinMode(5, OUTPUT); // Pin 5 output — Red LED  
6   pinMode(6, OUTPUT); // Pin 6 output — Blue LED  
7   pinMode(7, OUTPUT); // Pin 7 output — Green LED  
8   Serial.begin(9600);  
9   Serial.println("Enter your choice: ");  
10  // Enter 1 to toggle Red, 2 to toggle Blue, and 3 to toggle Green LED  
11 }  
12  
13 void loop()  
14 {  
15   if (Serial.available() > 0)  
16   {  
17     choice = Serial.read();  
18     if (choice != '\n' && choice != 'r')  
19     {  
20       if (choice == '1') // Toggle RED LED  
21       {  
22         digitalWrite(5, !digitalRead(5)); // Toggle = write opposite of  
23         current state  
24       }  
25       else if (choice == '2') // Toggle Blue LED  
26       {  
27         digitalWrite(6, !digitalRead(6));  
28       }  
29       else if (choice == '3') // Toggle Green LED  
30       {  
31         digitalWrite(7, !digitalRead(7));  
32       }  
33     }  
34   }  
35 }
```

```
27     Serial.println("Enter your choice: "); // Prompt again
    }
29 }
}
```

7.3 Temperature Status with LEDs

Program 3

```
int potPin = A0; // Analog pin connected to potentiometer
2 float temperature;

4 void setup()
{
6   pinMode(5, OUTPUT); // RED
   pinMode(6, OUTPUT); // Blue
8   pinMode(7, OUTPUT); // Green
   Serial.begin(9600);
10 }

12 void loop()
{
14   int potValue = analogRead(potPin); // Read potentiometer (0-1023)
   temperature = map(potValue, 0, 1023, 0, 50); // Map to 0C - 50C
16
   // Turn off all LEDs first
18   digitalWrite(5, LOW);
   digitalWrite(6, LOW);
20   digitalWrite(7, LOW);

22   // Light LED based on temperature
   if (temperature < 20.0)
24     digitalWrite(6, HIGH); // Blue - Cold
   else if (temperature <= 30.0)
26     digitalWrite(7, HIGH); // Green - Comfortable
   else
28     digitalWrite(5, HIGH); // Red - Hot

30   // Print temperature on Serial Monitor
   Serial.print("Temperature: ");
32   Serial.print(temperature);
   Serial.println(" C");
34
   delay(200); // Small delay for stability
36 }
```

7.4 LED Toogling using Switch

Program 4

```
1 char command;
3 void setup()
4 {
5     Serial.begin(9600);
6     pinMode(5, OUTPUT); // RED LED
7     pinMode(6, OUTPUT); // Blue LED
8     pinMode(7, OUTPUT); // Green LED
9     Serial.println("Enter command: 1, 2, or 3 to toggle LEDs");
10 }
11
12 void loop()
13 {
14     if (Serial.available() > 0)
15     {
16         command = Serial.read();
17
18         // Ignore newline and carriage return
19         if (command == '\n' || command == '\r')
20             ; // do nothing, skip this loop iteration
21         else
22         {
23             switch(command)
24             {
25                 case '1':
26                     digitalWrite(5, !digitalRead(5)); // Toggle RED
27                     Serial.println("LED1 toggled");
28                     break;
29                 case '2':
30                     digitalWrite(6, !digitalRead(6)); // Toggle Blue
31                     Serial.println("LED2 toggled");
32                     break;
33                 case '3':
34                     digitalWrite(7, !digitalRead(7)); // Toggle Green
35                     Serial.println("LED3 toggled");
36                     break;
37                 default:
38                     Serial.println("Invalid command");
39             }
40         }
41     }
42 }
```

7.5 Push Button (Press & Release) and External LED

Program 5

```
1 int buttonPin = 2;    // Push button connected to pin 2
2 int ledPin = 5;       // LED connected to pin 5
3 int buttonState;      // Variable to store button status
4
5 void setup()
6 {
7     pinMode(buttonPin, INPUT_PULLUP); // Use internal pull-up (active LOW)
8     pinMode(ledPin, OUTPUT); // LED as output
9 }
10
11 void loop()
12 {
13     buttonState = digitalRead(buttonPin); // Read button
14     if (buttonState == LOW) // Check if button is pressed
15     {
16         digitalWrite(ledPin, HIGH);
17         delay(5000);
18         digitalWrite(ledPin, LOW);
19     }
20 }
```

8 Loops

8.1 Blink an LED 5 Times

Program 1

```
1 void setup()
2 {
3     pinMode(LED_BUILTIN, OUTPUT); // Built-in LED
4 }
5
6 void loop()
7 {
8     for (int i = 1; i <= 5; i++) // Run 5 times
9     {
10         digitalWrite(LED_BUILTIN, HIGH); // Turn on LED
11         delay(1000);
12         digitalWrite(LED_BUILTIN, LOW); // Turn off LED
13         delay(1000);
14     }
15     // LED is currently OFF
16     while(1); // stay OFF indefinitely
17 }
```

8.2 LED Brightness Control with PWM

Program 2

```
1 int ledPin = 9; // PWM-capable pin
3 void setup()
4 {
5   pinMode(ledPin, OUTPUT); // Built-in LED
6 }
7
8 void loop()
9 {
10  // Fade in (0 -> 255)
11  for (int brightness = 0; brightness <= 255; brightness++)
12  {
13    analogWrite(ledPin, brightness); // Set LED brightness
14    delay(10);
15  }
16  // Fade out (255 -> 0)
17  for (int brightness = 255; brightness >= 0; brightness--)
18  {
19    analogWrite(ledPin, brightness);
20    delay(10);
21  }
22 }
```

8.3 Blink LED Until Button Pressed

Program 3

```
1 void setup()
2 {
3   pinMode(5, OUTPUT); // LED on Pin 5
4   pinMode(2, INPUT_PULLUP); // Press Button active LOW
5 }
6
7 void loop()
8 {
9   // Keep blinking LED until button is pressed
10  while (digitalRead(buttonPin) == HIGH)
11  {
12    digitalWrite(5, HIGH);
13    delay(300);
14    digitalWrite(5, LOW);
15    delay(300);
16  }
17  digitalWrite(5, LOW); // Once button is pressed, Turn off LED
18 }
```

8.4 Serial Input Validation

Program 4

```
//Keep waiting for a valid input using while
2 char command;

4 void setup()
{
6   Serial.begin(9600);
  Serial.println("Enter 'Y' to turn ON LED or 'N' to turn it OFF.");
8   pinMode(5, OUTPUT);
}

10 void loop()
12 {
  // Wait until something is typed
14   while (Serial.available() == 0)
  {
16     ;// Do nothing, just wait
  }

18   command = Serial.read();

20   if (command == 'Y' || command == 'y')
22   {
    digitalWrite(5, HIGH);
24     Serial.println("LED turned ON");
  }
26   else if (command == 'N' || command == 'n')
  {
28     digitalWrite(5, LOW);
    Serial.println("LED turned OFF");
30   }
  else
32   Serial.println("Invalid input. Please enter Y or N.");
}
```

8.5 Five Beeps break

Program 5

```
1 #define BUZZER 5
  // This is a macro. Replaces all occurrences of BUZZER with 5
3
5 void setup()
{
7   pinMode(BUZZER, OUTPUT);
}
```

```
9 void loop()
11 {
13     for (int i = 1; i <= 10; i++)
15     {
17         tone(BUZZER, 1000, 300); // Beep at 1kHz for 300ms
19         delay(500); // silence for 200 ms
21         if (i == 5)
23             break; // No beeps after 5th beep
25     }
27     delay(2000); // repeat after 2 seconds
29 }
```

8.6 LED Sequence with continue

Program 6

```
1 #define BUZZER 5
2 // This is a macro. Replaces all occurrences of BUZZER with 5
3
4 void setup()
5 {
6     pinMode(BUZZER, OUTPUT);
7 }
8
9 void loop()
10 {
11     for (int i = 1; i <= 10; i++)
12     {
13         tone(BUZZER, 1000, 300); // Beep at 1kHz for 300ms
14         delay(500); // silence for 200 ms
15         if (i == 5)
16             break; // No beeps after 5th beep
17     }
18     delay(2000); // repeat after 2 seconds
19 }
```

9 Arrays

9.1 LED Ping-Pong (Forward Sequence)

Program 1

```
1 int leds[] = {2, 3, 4, 5, 6}; // Pins where LEDs are connected
2 int ledCount = sizeof(leds)/sizeof(leds[0]); // Automatically calculate
3 // sizeof() returns size of data structure in Bytes
```

```
5 void setup()
6 {
7   for (int i = 0; i < ledCount; i++)
8     pinMode(leds[i], OUTPUT);
9 }
10
11 void loop()
12 {
13   // Move LED lights forward (left to right)
14   for (int i = 0; i < ledCount; i++)
15   {
16     digitalWrite(leds[i], HIGH);
17     delay(700);
18     digitalWrite(leds[i], LOW);
19   }
20 }
21 }
```

9.2 LED Ping-Pong (Back and Forth Sequence)

Program 2

```
1 int leds[] = {2, 3, 4, 5, 6}; // Pins where LEDs are connected
2 int ledCount = sizeof(leds)/sizeof(leds[0]); // Automatically calculate
3   // sizeof() returns size of data structure in Bytes
4
5 void setup()
6 {
7   for (int i = 0; i < ledCount; i++)
8     pinMode(leds[i], OUTPUT);
9 }
10
11 void loop()
12 {
13   // Move LED lights forward (left to right)
14   for (int i = 0; i < ledCount; i++)
15   {
16     digitalWrite(leds[i], HIGH); // Turn LED on
17     delay(700);
18     digitalWrite(leds[i], LOW); // Turn LED off
19   }
20   // Move LED lights backward (right to left)
21   for (int i = ledCount - 1; i >= 0; i--)
22   {
23     digitalWrite(leds[i], HIGH); // Turn LED on
24     delay(700);
25     digitalWrite(leds[i], LOW); // Turn LED off
26   }
27 }
```

```

27 }
  }

```

9.3 Push Button Cycles Through LEDs)

Program 3

```

int leds[] = {2, 3, 4, 5, 6};
2 int ledCount = sizeof(leds)/sizeof(leds[0]);
int buttonPin = 11; // Push button connected to Pin 11
4 int currentLED = 0; // Index of LED to be turned ON
int previousLED = 0; // Index of LED to be turned OFF

6 void setup()
8 {
    for (int i = 0; i < ledCount; i++)
10 {
        pinMode(leds[i], OUTPUT);
12         digitalWrite(leds[i], LOW); // Set all LEDs to OFF initially
    }
14     pinMode(11, INPUT_PULLUP);
}

16 void loop()
18 {
    int buttonState = digitalRead(buttonPin); // Read current button status
20     if (buttonState == LOW) // Check if button is pressed (active LOW)
    {
22         digitalWrite(leds[previousLED], LOW); // Turn OFF previous LED
        digitalWrite(leds[currentLED], HIGH); // Turn ON current LED
24         // Update LED indices
        previousLED = currentLED; // Store current LED index
26         currentLED = (currentLED + 1) % ledCount; // Move to the next LED (
        wraps around)
        delay(200);
28     }
}

```

9.4 Temperature Level Indicator using Temperature Sensor)

To change temperature in the emulator, run the simulation and then click on the temperature sensor. A temperature slide bar appears, allowing you to change temperature and monitor LEDs.

Program 4

```
1 int leds[] = {2, 3, 4, 5, 6};
  int ledCount = sizeof(leds)/sizeof(leds[0]);
3
4 void setup()
5 {
6     for (int i = 0; i < ledCount; i++)
7         pinMode(leds[i], OUTPUT);
8     Serial.begin(9600); // Initialize serial monitor for temp. display
9 }
10
11 void loop()
12 {
13     int sensorValue = analogRead(A0); // Read analog input from temperature
        sensor
        // Sensor output connected to Pin A0
14     float tempC = (1 / (log(1 / (1023.0 / sensorValue - 1)) / 3950 + 1.0 / 2
        98.15) - 273.15);
        // NTC thermistor formula approximation
15
16     // Display temperature on serial monitor
17     Serial.print("Temp: ");
18     Serial.print(tempC);
19     Serial.println(" Celcius");
20
21     int level; // Number of LEDs to turn ON based on temperature range
22
23     if (tempC < 20)
24         level = 0; // Below 20C, no LEDs
25     else if (tempC >= 20 && tempC < 24)
26         level = 1; // 20 - 24C, 1 LED
27     else if (tempC >= 24 && tempC < 28)
28         level = 2; // 24 - 28C, 2 LEDs
29     else if (tempC >= 28 && tempC < 32)
30         level = 3; // 28 - 32C, 3 LEDs
31     else if (tempC >= 32 && tempC < 36)
32         level = 4; // 32 - 36C, 4 LEDs
33     else
34         level = 5; // Above 36C, 5 LEDs
35
36     // Turn on LEDs according to level
37     for (int i = 0; i < ledCount; i++)
38     {
39         if (i < level)
40             digitalWrite(leds[i], HIGH); // Turn ON LEDs up to current level
41         else
42             digitalWrite(leds[i], LOW); // Turn OFF remaining LEDs
43     }
44
45     delay(1000);
46 }
47 }
```

10 Interacting with Motors

Before running these codes, make sure you add the Stepper.h library file in Wokwi's library manager. The library manager tab can be found beside the Arduino sketch.

10.1 Stepper Motor - Basic Stepper Rotation

Program 1

```
1 #include <Stepper.h>
3 const int stepsPerRevolution = 200;    // number of steps per full
    revolution
5 Stepper myStepper(stepsPerRevolution, 8, 9, 10, 11);
    // A- to pin 11, A+ to pin 10, B+ to pin 9 and B- to pin 8
7 void setup()
    {
9     myStepper.setSpeed(30);    // set motor speed (RPM)
    }
11
12 void loop()
    {
13     myStepper.step(stepsPerRevolution);    // rotate one full turn clockwise
15     delay(1000);
        myStepper.step(-stepsPerRevolution);    // rotate one full turn
            counterclockwise
17     delay(1000);
    }
```

10.2 Stepper Motor - Button Controlled

Program 2

```
#include <Stepper.h>
2
3 const int stepsPerRevolution = 200;
4 Stepper myStepper(stepsPerRevolution, 8, 9, 10, 11);
6 const int buttonPin = 2;    // Button connected to pin 2
8
9 void setup()
    {
10     pinMode(buttonPin, INPUT_PULLUP);    // Use internal pull-up resistor
        myStepper.setSpeed(30);    // Set motor speed to 30 RPM
12     }
14 void loop()
    {
```

```
16 // Button is active LOW (pressed = LOW)
   if (digitalRead(buttonPin) == LOW) {
18     myStepper.step(stepsPerRevolution); // Rotate one full turn
     delay(500); // Small delay to avoid bouncing
20   }
}
```

10.3 Stepper Motor - Repeated Back & Forth Motion

Program 3

```
1 #include <Stepper.h>
3 const int stepsPerRevolution = 200;
  Stepper myStepper(stepsPerRevolution, 8, 9, 10, 11);
5
  const int buttonPin = 2; // Button connected to pin 2
7
  void setup()
9  {
    pinMode(buttonPin, INPUT_PULLUP); // Use internal pull-up resistor
11    myStepper.setSpeed(30); // Set motor speed to 30 RPM
  }
13
  void loop()
15  {
    // Button is active LOW (pressed = LOW)
17    if (digitalRead(buttonPin) == LOW) {
      myStepper.step(stepsPerRevolution); // Rotate one full turn
19      delay(500); // Small delay to avoid bouncing
    }
21  }
```

11 User Defined Functions

11.1 Modular LED Blink Function

Program 1

```
1 const int ledPin = 5;
  // Variables declared using const keyword cannot be changed
3
  void setup()
5  {
    pinMode(ledPin, OUTPUT);
7  }
```

```
9 void loop()
11 {
12     blinkLED(ledPin, 1000); // blink at 1s interval
13 }
14
15 void blinkLED(int pin, int duration)
16 {
17     digitalWrite(pin, HIGH);
18     delay(duration);
19     digitalWrite(pin, LOW);
20     delay(duration);
21 }
```

11.2 LED Pattern with Function Call

Program 2

```
1 int leds[] = {2, 3, 4, 5}; // LED pins connected to Arduino
2 int ledCount = sizeof(leds)/sizeof(leds[0]); // Number of LEDs
3
4 void setup()
5 {
6     for (int i = 0; i < ledCount; i++) // Set all LED pins as output
7         pinMode(leds[i], OUTPUT);
8 }
9
10 void loop()
11 {
12     runPattern(leds, ledCount, 200); // Run LED pattern with 200 ms delay
13 }
14
15 // Function to turn LEDs ON and OFF sequentially
16 void runPattern(int pins[], int count, int delayTime)
17 {
18     for (int i = 0; i < count; i++)
19     {
20         digitalWrite(pins[i], HIGH); // Turn ON current LED
21         delay(delayTime); // Wait
22         digitalWrite(pins[i], LOW); // Turn OFF current LED
23     }
24 }
```

11.3 Temperature Reader Function

Program 3

```
1 float readTemp(int pin)
2 {
3   int sensorValue = analogRead(pin); // Read analog value from sensor
4   float tempC = (1 / (log(1 / (1023.0 / sensorValue - 1)) / 3950 + 1.0 / 2
5     98.15) - 273.15); // Convert to C using NTC formula
6   return tempC; // Return temperature value
7 }
8
9 void setup()
10 {
11   Serial.begin(9600); // Initialize serial communication
12 }
13
14 void loop()
15 {
16   float temperature = readTemp(A0); // Get temperature from sensor on A0
17   Serial.print("Temperature: ");
18   Serial.print(temperature);
19   Serial.println(" Celsius"); // Display temperature in C
20   delay(1000); // Wait 1 second before next reading
21 }
```

11.4 Stepper Motor Direction Control Using Function

Program 4

```
1 #include <Stepper.h>
2
3 const int stepsPerRev = 200; // Steps per full revolution
4 Stepper motor(stepsPerRev, 8, 9, 10, 11); // Initialize stepper motor pins
5
6 void setup()
7 {
8   motor.setSpeed(30); // Set motor speed (RPM)
9   Serial.begin(9600); // Start serial communication
10 }
11
12 void loop()
13 {
14   rotateMotor('F'); // Rotate clockwise
15   delay(1000);
16   rotateMotor('R'); // Rotate counter-clockwise
17   delay(1000);
18 }
19
20 // Function to rotate motor based on direction
21 void rotateMotor(char direction)
22 {
23   if (direction == 'F')
24   {
25     // Clockwise rotation logic
26   }
27   else if (direction == 'R')
28   {
29     // Counter-clockwise rotation logic
30   }
31 }
```

```
24 {  
26   Serial.println("Rotating Clockwise");  
    motor.step(stepsPerRev); // One full clockwise revolution  
28 }  
    else if (direction == 'R')  
    {  
30   Serial.println("Rotating Counter-Clockwise");  
    motor.step(-stepsPerRev); // One full counter-clockwise revolution  
32 }  
}
```
